

Introducing Cody

Your personal coding bot

Cody is a secure automated solution that has been designed to utilize the user interface of the EMR to execute a business process. The bot standardizes patient data – enabling you to use this data to provide **more proactive care** to your patients.

HOW IT WORKS:

- Cody connects remotely to the EMR and runs a number of algorithms searching for patients with one or more conditions
- Cody opens each patient chart, reviews the Problem List and adds a ICD-9 or SNOMED-CT code for each condition listed
- If clinical validation is required before a condition is coded, Cody generates a report for review

For optimal use, consider pairing our bots: Cody improves EMR data quality to support identification of complex patients. These patients would also benefit from a coordinated care approach ([Sharon](#)) and improved patient outcomes ([Bernie](#)).

BENEFITS:

- Once your patient populations are coded accurately in the patient chart, the likelihood of identifying missed appointments and billing opportunities according to stated guidelines increases
- Cody also operates at a rate six times faster than manual coding, leaving more time for you and your staff to focus on higher value tasks
- When data is standardized in the EMR, it not only improves data quality, but it also enables clinicians to provide proactive care to their patients
