

Introducing Sharon

Sharing is caring

Sharon is a secure automated solution that enables secure digital sharing of care plan data elements in near real-time between two different health information systems used by primary care (EMRs) and home and community care (CHRIS).

HOW IT WORKS:

- Sharon remotely connects to an EMR and collects/extracts Coordinated Care Plan (CCP) data, then connects to Health Partner Gateway (HPG)
- The CCP in both the HPG and the EMR are updated simultaneously with the most recent additions to the plan
- Updates made in HPG are automatically updated in CHRIS
- This information is also viewable to acute care providers through Regional Clinical Viewers

Do you know your high needs patients? Pair Sharon with our bot **Cody** to improve identification of complex patients and enable information sharing between providers involved in the patient's circle of care.

BENEFITS:

- Avoids unnecessary and time-consuming duplication of data entry in multiple information systems
- Ensures that all healthcare providers across the continuum of your Ontario Health Team (OHT) have access to the most recent CCP, so everyone can make better-informed decisions based on the patient's specific goals
